

ABSTRACT

A device for applying wallpaper borders to walls and ceilings, which is anchored in place by conventional pin means pushed through holes in the surface of the device, for hands free maneuverability. The device is preferably composed of plastic which is waterproof, easily cleaned, safe, and durable. The device is either transparent or made of mesh material, so the user can see when the wallpaper border is nearing its end without having to stop the application process. Handles of varying lengths adjust to wall and ceiling measurements, while the device's cup's length can vary to adjust to different widths of wallpaper border. A cap with a notched rim can also be fitted on the device to secure the wallpaper border inside the device. The device is easy enough for a novice to use and also creates an error free finish suitable for professional use.
